

V1 · The Order-Taker

VOICE TASK

DIFFICULTY 4/10

A busy cloud-kitchen wants to take orders by voice instead of tying up staff on the phone.

■ Build

A voice agent that takes a complete food order, start to finish.

■ Must handle

- Understand items from the menu we give you, including modifiers (“no onions,” “large,” “extra cheese”).
- Keep a running total and read it back.
- Handle changes mid-order (“actually make it two,” “cancel the fries”).
- Confirm the full order before ending the call.
- One curveball gracefully: a customer asks for something not on the menu.

Data model — The schema behind the order — menu items, the modifier/variant options each item allows (with price deltas), an order, and its line items. Model how one line carries several modifiers and how the total is *derived*, never a stored guess.

■ We'll give you

A one-page menu PDF — ~15 items across 3 categories with sizes, add-ons and price deltas, plus two combo meals.

■ Out of scope

Payment, real POS integration, login/accounts.

■ The bar for “good”

A real spoken order comes out *correct* — including a change made mid-call — and it feels fast and natural, not like a phone tree.

Submit: a **live link** we can open and use + a **4–6 min video** (demo it working and walk us through your data model). **No repo.**
